$$\text{minimize } \sum_{i=1}^m \left(b(x_i) - z_i^{(0)} \right)^2 \quad \text{--- (1)}$$

optimization problem:- we want to find a, b, c for values in \mathcal{X} such that we minimize the function 1.

ii) Given, $a=0, b=5.5$

$$z^{(0)} = y_i - f_x^{(0)} = \begin{bmatrix} 1.417 \\ 0.917 \\ 0.417 \\ -2.583 \\ -1.583 \\ 1.417 \end{bmatrix}$$

For minimum, take derivative and equate to 0.

Iteration 2 :-

2 i) $a=1, c = 0.4$

$$\min \sum_{l=1}^2 f_l(x_l) - \begin{bmatrix} 1.42 \\ 0.92 \\ 0.42 \\ -0.48 \\ 0.52 \\ 1.42 \end{bmatrix}$$

Goal :-

$$(f_l(x) - 2^{(i)})$$

↑
we always wanted
to reduce this,
 $|c - x_l|$ should
↑ reduce.

This function would be minimized if we subtract c from all values except

-0.58 (as $a=1$).

It is guaranteed that the function would minimize and as values in $2^{(1)}$.

So, any $b > \max(x)$ would suffice

$\therefore b = 60.1$ (rounded off to nearest 0.1)

This is not generic, it depends on the value of c .

3 iii) $F^2(x) = \begin{bmatrix} 0.4 \\ 0.4 \\ 0.4 \\ 0 \\ 0.4 \\ 0.4 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -2.1 \\ -2.1 \\ 0 \end{bmatrix} + \begin{bmatrix} 4.58 \\ 4.58 \\ 4.58 \\ 4.58 \\ 4.58 \\ 4.58 \end{bmatrix} = \begin{bmatrix} 4.98 \\ 4.98 \\ 4.98 \\ 2.48 \\ 2.88 \\ 4.98 \end{bmatrix}$
